

Inferential Statistics: Cascade Screening Practice (Relatives)

Pearson Correlation Analysis

This report quantifies “Cascade Practice” by examining exactly *how far* the participant went in getting their relatives screened.

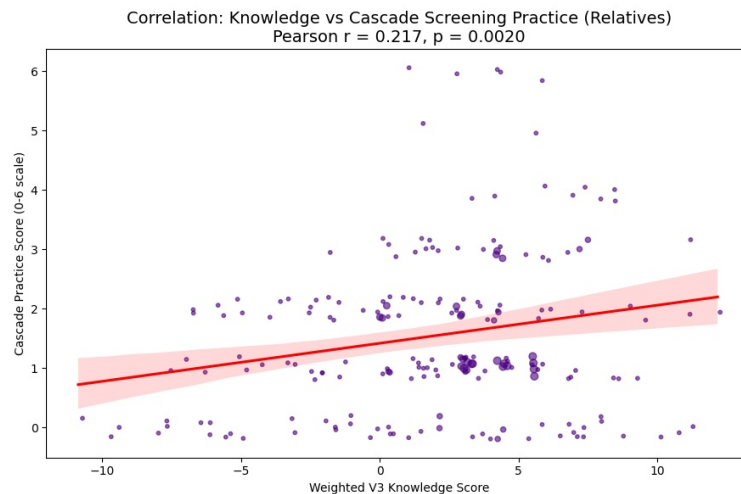

The Cascade Practice Score (Scale 0-6): * First-degree relatives (parents, siblings, children): All (+2), Some (+1), Don’t know (+0) * Second-degree relatives (grandparents, uncles, aunts): All (+2), Some (+1), Don’t know (+0) * Third-degree relatives (cousins): All (+2), Some (+1), Don’t know (+0)

We then tested this 0-6 behavioral score against both the participant’s Knowledge and their Cascade Attitude.

1. Knowledge vs. Cascade Practice (Relatives)

Does a higher clinical understanding of thalassemia translate into more extensive family screening?

- **Pearson Correlation Coefficient (r):** 0.217
- **P-Value:** 0.0020
- **Conclusion: Statistically Significant Correlation ($p < 0.05$).** Higher knowledge leads to more extensive screening.

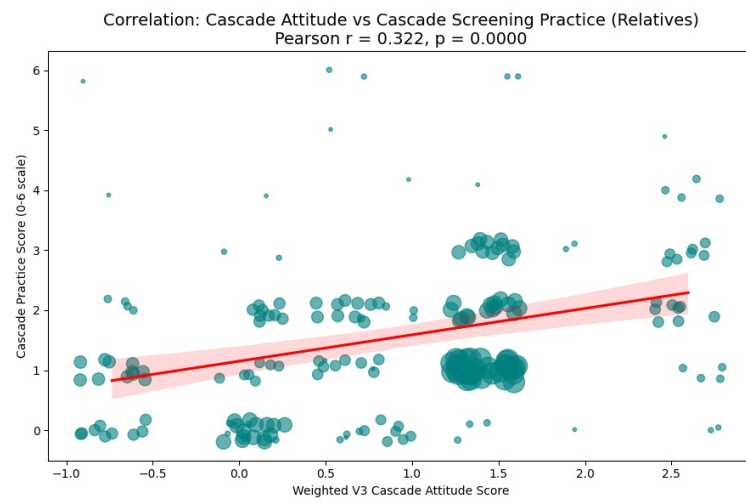

Scatter Plot: Knowledge vs Practice

2. Cascade Attitude vs. Cascade Practice (Relatives)

Does a strong belief that family members should be screened translate into actual screening execution?

- **Pearson Correlation Coefficient (r):** 0.322

- **P-Value:** 0.0000
- **Conclusion: Statistically Significant Correlation ($p < 0.05$).** Positive attitudes translate directly into action.
