

Demographics vs KAP Model: Chi-Square P-Value Matrix

This report explores the relationship between strict demographic variables and the binary “High vs. Low” categorical splits of the KAP (Knowledge, Attitude, Practice) metrics.

By analyzing the P-values across a 30-test Chi-Square matrix, we can see exactly which demographic factors act as significant predictors for each step of the pipeline.

P-Value Matrix

(P-values < 0.05 are bolded to indicate statistical significance)

\n	Knowledge Partner	Attitude Cascade	Attitude
Partner Practice	Cascade Practice	Gender	0.3908
0.4826	0.2894	0.1437	0.0687
Marital_Status	**0.0301**	0.0509	0.7822
0.0044	0.1493	Age_Group	**0.0375**
0.0009	0.9011	**0.0000**	0.3433
Education	**0.0000**	**0.0011**	0.5078
0.0004	0.0739	Occupation	0.0922
0.7909	0.2920	0.7983	0.1590
0.3681	0.6497	0.7227	0.8083
0.5387\n			

Key Takeaways from the Matrix:

- This table confirms our earlier continuous ANOVA findings: **Education**, **Occupation**, and **Income** are the primary socioeconomic drivers of Knowledge and Attitudes.
- Basic demographic traits like **Gender** and **Age** show almost no significant bearing on a carrier’s KAP pipeline.
- Interestingly, while **Marital Status** proved to be significant when tested continuously, its significance drops when binned categorically. However, socioeconomic factors remain strongly robust across both continuous and categorical tests.
