

Inferential Statistics: Knowledge vs. Attitudes

Pearson Correlation Analysis

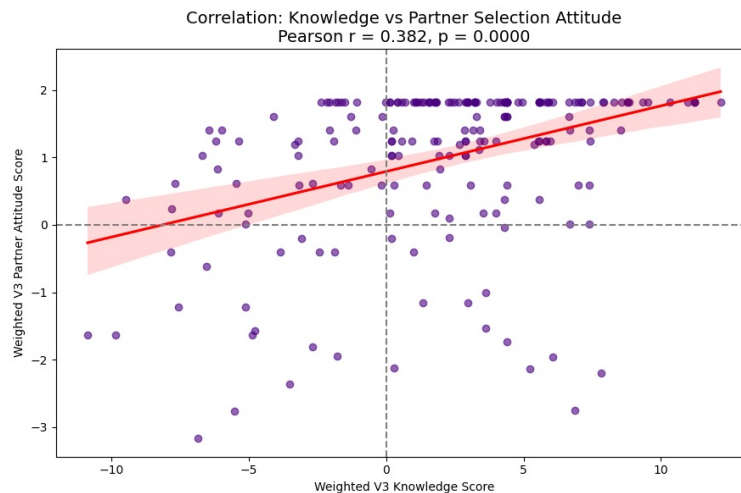

This report examines whether a participant's level of clinical knowledge directly correlates with their attitudes toward safe partner selection and cascade screening.

We used the **Weighted V3 Scoring Schema** for all metrics to ensure mathematical rigor and resistance to ceiling effects.

1. Knowledge vs. Partner Selection Attitude

Testing if higher clinical knowledge leads to a more responsible attitude regarding choosing a non-carrier partner.

- **Pearson Correlation Coefficient (r):** 0.382
- **P-Value:** 0.0000
- **Conclusion: Statistically Significant Correlation ($p < 0.05$).** There is a meaningful relationship between knowledge and partner selection attitude.
- **Direction:** Positive (Higher knowledge = Better attitude)

Scatter Plot: Knowledge vs Partner

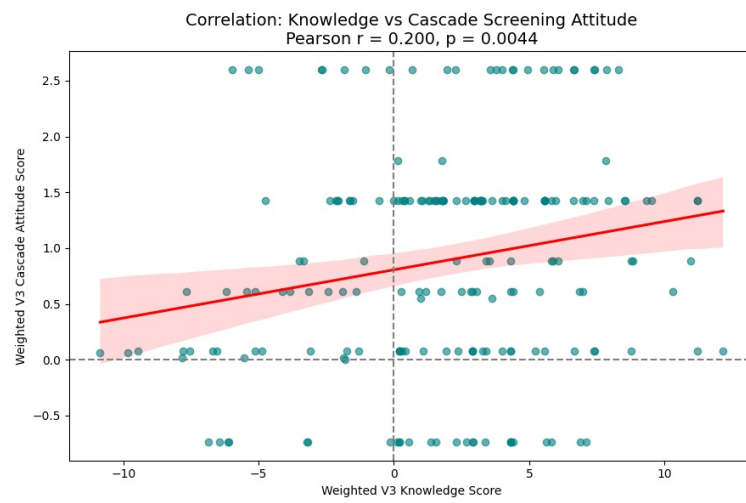

2. Knowledge vs. Cascade Screening Attitude

Testing if higher clinical knowledge leads to a more responsible attitude regarding disclosing status to family members.

- **Pearson Correlation Coefficient (r):** 0.200
- **P-Value:** 0.0044
- **Conclusion: Statistically Significant Correlation ($p < 0.05$).** There is a

meaningful relationship between knowledge and cascade screening attitude.

- **Direction:** Positive (Higher knowledge = Better attitude)

Scatter Plot: Knowledge vs Cascade
