

V3 Cascade Screening Attitude Analysis

This report visualizes the Cascade Screening attitudes using the optimized V3 schema (excluding Q36 as it is a practice variable, and incorporating perceived behavioral control from Q39).

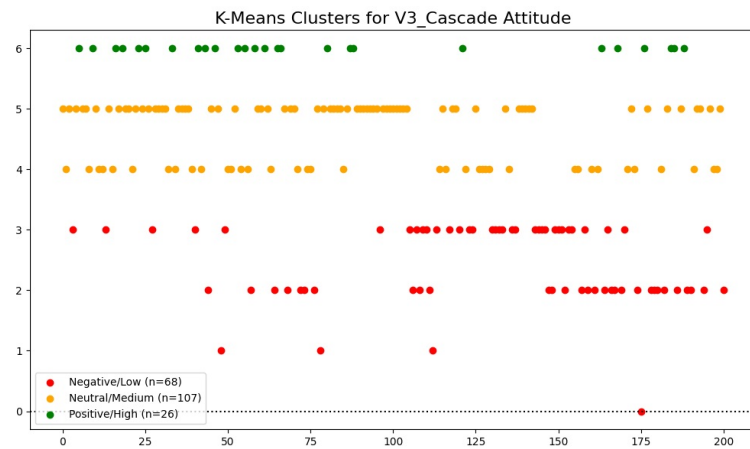

V3 Distribution

The distribution is incredibly revealing. By assigning severe penalties (-2) to those who actively disagree with screening importance, we can clearly isolate a very small, but dangerous, subset of the population whose scores plunge into the negatives.

V3 K-Means Clustering (k=3)

The clustering algorithm found natural breaking points in the data. The “Negative/Low” cluster is small but highly distinct, representing participants who actively resist the idea of family screening.

K-Means Clusters
