

V3 Partner Selection Attitude Analysis

This report visualizes the Partner Selection attitudes using the optimized V3 schema (excluding practice/action variables and widening the penalty scale to -3).

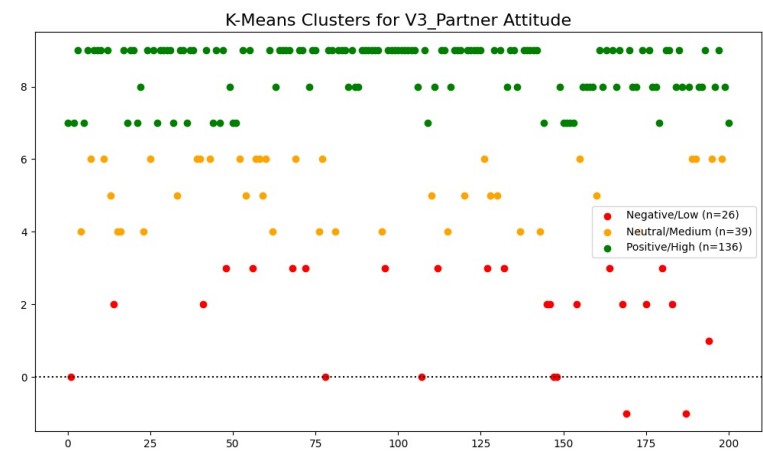

V3 Distribution

By applying extreme penalties (-3) for dangerous attitudes (like accepting consanguineous marriage), the distribution completely shatters the ceiling effect. We now have a true continuous spectrum of attitudes ranging from highly protective to dangerously misinformed.

V3 K-Means Clustering (k=3)

With the mathematical variance increased, K-Means successfully separated the cohort into three highly distinct tiers. The zero line flawlessly demarcates the boundary between positive and negative sentiment.

K-Means Clusters
