

Weighted V3 Cascade Screening Attitude Analysis

This report visualizes the Cascade Screening attitudes applying the cross-question statistical $(1-p)$ weighting to the optimized V3 schema.

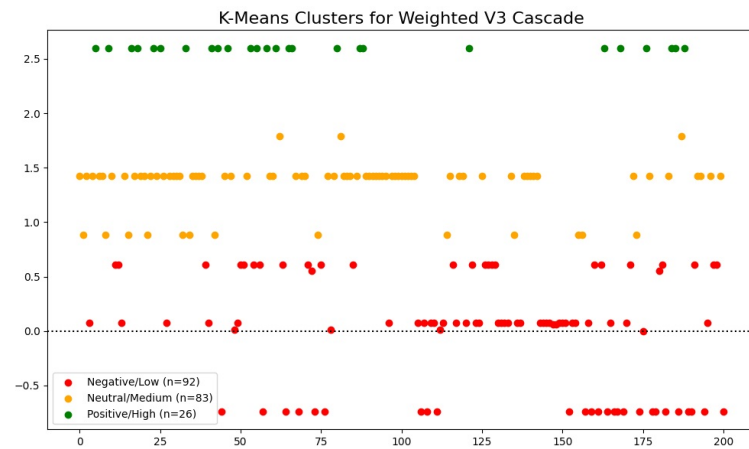

The Distribution

The inverse-frequency scaling reveals an incredible amount of nuance. It completely eradicates any integer plateaus, treating every participant's combination of answers as mathematically unique based on the cohort's statistical baseline.

K-Means Clustering (k=3)

Because the weighting scales down common answers and scales up rare outliers, the clustering visually expands, separating the true positive outliers from the “neutral” majority and exposing the negative outliers.

K-Means Clusters
